1. INTRODUCTION

This report summarizes meteorological measurements collected at the Resolution Copper Mine monitoring system. The meteorological monitoring system is comprised of two separate monitoring stations, one at the location of the east plant (KC1) near the main entrance to the mine and one at the location of the west plant (KC2), near the town of Superior. Monitoring is conducted at two sites due to the difference in topography between the two sites. The area around KC1 is at an elevated mountainous area; KC2 is located at the base of the mountains. The Resolution Copper Mine is a previously decomissioned underground copper and molybdenum mine that will be re-opened by Resolution Copper Company (Resolution), a member of Rio Tinto Group. The Resolution Mine is located just east of Superior, Arizona in Pinal County as shown in Figure 1.1.

The Resolution Project is located in the historic Pioneer Mining District three miles East of Superior, Arizona (See Figure 1.2). Elevations in the area range from to 2,763 feet above sea level in the town of Superior, while nearby Apache Leap Mountain reaches over 4,700 feet above sea level. Terrain east of the property is highly mountainous. Terrain to the west is less mountainous and becomes relatively flat approximately 10 miles west of Superior and into Phoenix.

The purpose of the monitoring program is to provide the measurements necessary to establish existing meteorological conditions at the proposed site of the Resolution Mine in support of a future air quality permit application for the facility. The monitoring program, including instrument audits, calibrations, maintenance and data processing, is being conducted by Applied Environmental Consultants (AEC). A full complement of meteorological monitoring comprised of measurements of wind speed, wind direction, differential temperature (delta-T), temperature, relative humidity, barometric pressure, solar radiation, evaporation, and precipitation, began at the West Met Site (KC2) on March 26, 2009. The East Met Site (KC1), which measures the same variables, began operation on April 17, 2009. This document summarizes the monitoring data collected during the first quarter of 2011 (January, February and March).

The ensuing sections of this report summarize the measurements made during the quarter. A description of the monitoring program is presented in Section 2. This is followed by a summary of the meteorological data presented in Section 3, data recovery statistics presented in Section 4, and quality assurance data presented in Section 5. Complete listings of the meteorological data, along with associated audit reports, are presented in the appendices.

2. MONITORING PROGRAM

Meteorological parameters being measured at the KC1 and KC2 monitoring stations include wind speed and wind direction at 10 meters, differential temperature between 2 and 10 meters, ambient temperature at 2 meters, relative humidity, barometric pressure, solar radiation, pan evaporation and precipitation. Measurements of sigma theta (standard deviation of the horizontal wind direction fluctuations) are also being made as a backup for stability data. Sigma theta data are not summarized in Section 3 below but are presented in Appendix A. A listing of the meteorological instruments is provided in Table 2.1. The instruments used at both monitoring sites are identical

All monitoring equipment, siting, operations and data processing conform to the criteria specified in the following EPA documents: *Ambient Monitoring Guidelines for Prevention of Significant Deterioration (PSD)*, EPA-450/4-87-007, 1987; *Meteorological Program Guidance for Regulatory Modeling Applications*, EPA-450/4-87-013, Revised February, 2000; and *Volume IV: Meteorological Measurements Versions 2.0,* EPA-454/B-08-002, March 2008.

3. METEOROLOGICAL DATA SUMMARIES

Meteorological measurements for each parameter, except humidity, were reduced to one-hour averages and are expressed as hour ending averages. The relative humidity data were collected at the end of each hour. Hourly listings for each of the measured parameters are presented in Appendix A. Data for monitoring sites KC1 and KC2 are presented in separate tables.

3.1 Wind Speed/Wind Direction

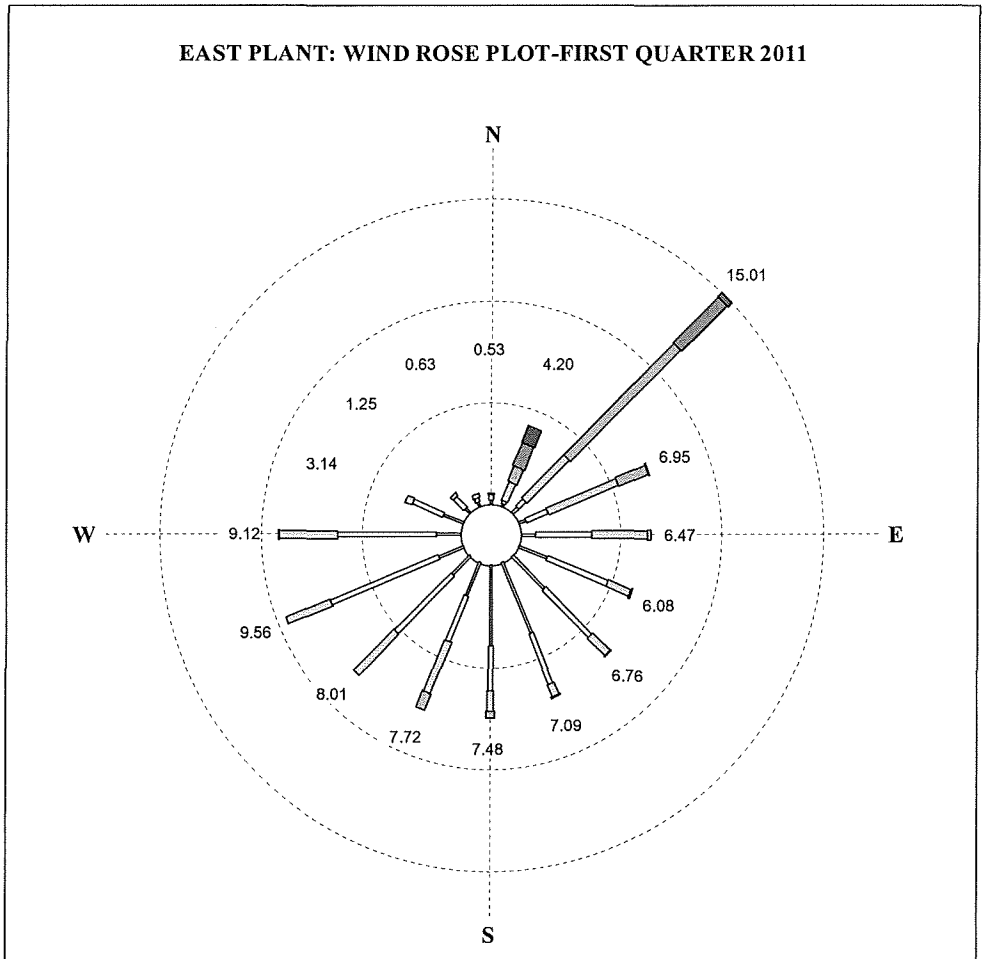

Wind speed statistics for the quarter are presented in Tables 3.1 and 3.2. Wind roses from each monitoring site for the quarter are presented in Figures 3.1 and 3.2.

4. DATA RECOVERY

Data recovery statistics for the quarter are summarized for each site in Tables 4.1 and 4.2. Data were invalidated on 1/11/11 for site KC1 and 3/22/11 for site KC2 due to instrument audits. Missing data in January at site KC1 were due to power loss. Missing data at site KC2 were due to voltage regulator and power backup system failure. The relative humidity data were invalidated due to reading out-of-range. The evaporation data were invalidated due to precipitation and pan refills. Note that the evaporation pan at site KC1 was found empty during the audit.

5. QUALITY ASSURANCE

Routine quality assurance (QA) procedures were employed to check the meteorological data collected during the quarter.

5.1 Meteorological Measurements

Quality assurance procedures utilized to verify the integrity of the measured meteorological data include the following:

- review of the data to evaluate values and changes from one hour to the next
- performance audits of the field sensors conducted twice per year

5.1.1 Review of Data

The individual meteorological observations were screened according to the criteria listed in Table 5.1. Any data outside of the quality control limits were investigated by the Project Manager and the QA Officer for possible invalidation. The final validity determination was made after comparing the suspect data with other pertinent data to determine whether the data were invalid or whether an unusual meteorological event occurred. No data were invalidated during the quarter based on these screening procedures.

5.1.2 Audit of Field Sensors

Performance audits of the meteorological sensors of the KC1 and KC2 monitoring sites were conducted on January 11 and March 22, 2011, respectively. Performance audits were performed to determine if the instruments were operating within acceptable limits. The audit consisted of physical challenges of the field sensors and comparison of the sensor responses to known values. Results of the audits are summarized in Table 5.2 for site KC1 and Table 5.3 for site KC2. A complete meteorological audit report is presented in Appendix B.

Table 5.1 Meteorological Data Screening Criteria

Meteorological Variable	Screening Criteria
	Flag the data if the value:
Temperature (ambient and 2-meter and 10-meter differential temperature readings)	- is less than avg. monthly low or greater than avg. monthly high - is greater than a 5 °C change from the previous hour - does not vary by more than 1 °C for 12 consecutive hours
Differential Temperature	- is less than -0.1 °C/m during nighttime - is greater than 0.1 °C/m during daytime - is less than -3 °C or greater than 5 °C
Wind Speed	- is less than zero or greater than 5 m/s - does not vary by more than 0.1 m/s for 3 consecutive hours - does not vary by more than 0.5 m/s for 12 consecutive hours
Wind Direction	- is less than 0° or greater than 360° - does not vary by more than 1° for 3 consecutive hours - does not vary by more than 10° for 18 consecutive hours
Sigma Theta	- is less than 0° or greater than 90°
Precipitation	- is greater than 1 inch in one hour - is greater than 3 inches in 24 hours
Relative Humidity	- is less than 0% or greater than 100% - does not vary by more than 5% for 18 consecutive hours - normal diurnal patterns exist
Barometric Pressure	- is greater than 25.5 in Hg (based on elevation of site) - is less than 23.5 in Hg (based on elevation of site) - changes by more than 0.2 in Hg in three hours
Solar Radiation	- is greater than zero at night - is greater than the maximum possible for date and latitude - normal diurnal patterns exist
Evaporation	- is greater than 0.5 inches per day - monthly total exceeds monthly average for area

1. INTRODUCTION

This report summarizes the results of a performance audit of two separate monitoring stations, one at the location of the east plant (KC1) and the west plant (KC2), conducted by Applied Environmental Consultants, a JBR company. (AEC) on January 11 and March 22, 2011 respectively. The Resolution Mine is located just east of Superior, Arizona in Pinal County as shown in Figure 1.1. The meteorological performance audit was conducted according to the United States Environmental Protection Agency (EPA) guidance documents *Ambient Monitoring Guidelines for Prevention of Significant Deterioration (PSD)*, EPA-450/4-87-007, May 1987, and the EPA *Quality Assurance Handbook for Air Pollution Measurement Systems, Volume IV: Meteorological Measurements Versions 2.0,* EPA-454/B-08-002, March 2008.

The ensuing sections of this appendix present the details of the audit and the audit results. Section 2 contains a description of the performance audit procedures, Section 3 contains the audit criteria and the audit results are presented in Section 4.

2. DESCRIPTION OF PERFORMANCE AUDIT PROCEDURES

The meteorological performance audit process included an overall inspection of the monitoring system and physical challenges of the instruments. A complete listing of the audited meteorological equipment is presented in Table 2.1. The following sections describe the audit procedures for each meteorological parameter.

2.1 Wind Speed

The wind speed sensor was visually inspected to ensure that it was functional and well maintained. The wind speed sensor was challenged by removing the propeller, attaching an R.M. Young 18802 variable speed anemometer drive to the sensor shaft, and generating simulated audit wind speeds. The sensor response to seven different rates of rotation as recorded by the data acquisition system (DAS) was compared to the simulated wind speeds. The mean absolute error of the sensor responses was then calculated.

The wind speed starting threshold was checked by attaching a Waters Series 366 torque watch to the sensor shaft. Starting torque is related to the sensor starting threshold by a manufacturer supplied relationship. By rotating the torque watch shaft clockwise and counterclockwise, the starting torque can be measured.

2.2 Wind Direction

To evaluate the alignment of the wind direction sensor, the wind vane was pointed toward previously surveyed points and the DAS responses were recorded. These sensor responses were then compared to the known direction and a mean absolute alignment error was calculated. Next, the wind direction sensor was removed from the tower and attached to a R.M. Young 18112 wind direction calibrator to evaluate the sensor's internal response characteristics. The vane was aligned to 12 different directions from 10^{o} to 340^{o} at 30^{o} increments, and the sensor response was recorded. The mean absolute error of the sensor responses was then calculated.

Starting torque for the wind direction sensor was determined by attaching an R.M. Young Vane Torque Gauge, Model 18331 over the center of the wind direction sensor shaft. The threshold torque necessary to start and maintain the movement of the sensor was determined. Several points around the 360^{o} instrument range were tested and compared to the manufacturer's suggested starting torque. Upon completion of the audit, the wind direction sensor was reinstalled and the alignment was rechecked to verify proper alignment with true north.

2.3 Differential Temperature

The differential temperature system being utilized consists of a matched pair of temperature sensors which are placed at 2-meters and 10-meters above the ground. The audit for the two sensors was conducted under two different procedures. First, the 2-meter and 10-meter temperature sensors were audited by immersing both sensors together in water baths of different temperatures (ice, ambient, and upscale) together with an Fisher Scientific NIST-traceable digital thermometer (see Appendix B-EQUIP). For each observation, the bath was stirred to ensure a uniform temperature throughout and the temperature sensors and audit thermometer responses were allowed to stabilize. Five paired measurements were taken and the differences between both the 2-meter and 10-meter sensors and the audit thermometer were averaged for each of the three water baths.

The purpose of the second audit procedure is to verify that both differential temperature sensors have similar readings under varying temperature conditions. Thus, the audit thermometers are used only as a reference to ensure the temperature conditions are similar during the test. The second audit procedure involves immersing the 2-meter temperature sensor in an ambient water bath with an audit thermometer concurrently with immersing the 10-meter temperature sensor and a second audit thermometer in an ice water bath. Both bathes were stirred to ensure uniform temperature. Five measurements for each bath were taken and the differences between the 10-meter and 2-meter temperature sensors were averaged. Then, the 2-meter and 10-meter temperature sensors were placed in opposite baths. Another five measurements for each bath were recorded and the differences between the 10-meter and 2-meter temperature sensors were averaged. Finally, the absolute difference between the average differential temperatures for each bath was then calculated.

2.4 Relative Humidity

The relative humidity sensor was audited by comparison measurements with an EXTECH RH390 at ambient conditions. The RH390 measures relative humidity by a precision capacitance sensor and is

NIST traceable (see Appendix B-EQUIP). The absolute difference between the relative humidity sensors from the psychrometer and the field sensor was determined.

2.5 Temperature

The temperature probe at each location was audited by measuring the ambient air temperatures together with a Fisher Scientific traceable digital thermometer. The Fisher thermometer was previously certified against a NIST-traceable thermometer (see Appendix B-EQUIP). For each observation, the temperature probe and audit thermometer responses were allowed to stabilize. Five paired measurements were taken and the mean absolute differences were calculated.

2.6 Barometric Pressure

The ambient barometric pressure was compared to the barometric pressure as measured by a hand held barometer (70510462) manufactured by Druck Company. Five measurements were taken and the mean absolute difference was determined. The Druck pressure indicator was previously certified to an NIST-traceable pressure standard (see Appendix B-EQUIP).

2.7 Solar Radiation

The solar radiation sensor was audited by comparing the sensor to a reference standard pyranometer (PY69180) manufactured by Li-Cor Environmental. Both sensors were connected to the same datalogger for the most accurate performance audits. Five hourly readings were taken and the mean absolute difference was determined. The reference sensor was annually certified by the manufacturer (see Appendix B-EQUIP).

2.8 Evaporation

The Novalynx evaporation gauge was audited by subjecting the gauge to a known volume of water corresponding to 1.00" of water. The water was introduced to the sensor at a nominal rate to preclude splashing from the evaporation pan. The responses recorded by the computer were compared to the 1.00" introduced.

2.9 Precipitation

The Campbell tipping bucket was audited by subjecting the sensor to a known volume of water corresponding to 1.00" of water. The water was introduced to the sensor at a nominal rate to preclude splashing from the tipping bucket. The responses recorded by the computer were compared to the 1.00" introduced.

3. PERFORMANCE AUDIT CRITERIA

The performance audit criteria and applicable EPA references used to evaluate the monitoring system are presented in Table 3.1. All criteria meet or exceed those required by the EPA PSD guidelines and the EPA QA Handbook referenced above.

MANUFACTURERS CERTIFICATE OF CALIBRATION

This is to certify that the thermometer listed below has been tested in our most modern calibration laboratory against a *National Institute of Standards and Technology certified master standard. All temperatures in this report are based on the International Temperature Scale of 1990 (ITS-90).

Thermometer Description: ASTM 63F 18/89F.;2 Degree F

Thermometer Serial No.: 1F9975

READING OF THERMOMETER	STANDARD TEMPERATURE	CORRECTION
20.02	20.00	-0.02
32.00	32.00	0.00
50.00	50.00	0.00
70.00	70.00	0.00
87.98	88.00	0.02

Estimated uncertainties in the above corrections do not exceed 0.05 degree up to 89 degrees F.

If no sign is given on the correction, the true temperature is higher than the indicated temperature. If the sign given is negative, the true temperature is lower than the indicated temperature.

The tabulated corrections apply provided the ice-point reading, taken after exposure for not fewer than three days to a temperature of about 23 degrees C (73 degrees F), is as shown above. If the ice-point reading is found to be higher (or lower) than stated, all other readings will be higher (or lower) by the same amount. If the thermometer is used at a given temperature shortly after being heated to a higher temperature, an error of 0.01 degree or less for each 10 degree difference between the two temperatures may be introduced. These corrections apply if the thermometer is used in its upright position.

This Instrument was calibrated using Instruments Traceable to National Institute of Standards and Technology.

A Test Uncertainty Ratio of at least 4:1 is maintained unless otherwise stated and is calculated using the expanded measurement uncertainty. Uncertainty evaluation includes the instrument under test and is calculated in accordance with the ISO "Guide to the Expression of Uncertainty in Measurement" (GUM). The uncertainty represents an expanded uncertainty using a coverage factor k=2 to approximate a 95% confidence level. In tolerance conditions are based on test results falling within specified limits with no reduction by the uncertainty of the measurement. The results contained herein relate only to the item calibrated. This certificate shall not be reproduced except in full, without written approval of Control Company.

Nominal=Standard's Reading; As Left=Instrument's Reading; In Tol=In Tolerance; Min/Max=Acceptance Range; ±U=Expanded Measurement Uncertainty; TUR=Test Uncertainty Ratio; Accuracy=±(Max-Min)/2; Min = Nominal(Rounded) - Tolerance; Max = Nominal(Rounded) + Tolerance; Date=MM/DD/YY

Maintaining Accuracy:

In our opinion once calibrated your Digital Thermometer should maintain its accuracy. There is no exact way to determine how long calibration will be maintained. Digital Thermometers change little, if any at all, but can be affected by aging, temperature, shock, and contamination.
